

TRANSPLANTS

Transplanting is a stressful period for young bedding plants. Minimizing transplant shock keeps plants growing vigorously, avoiding unnecessary setbacks which can delay flowering and reduce yields.

AGGRAND 4-3-3 Natural Fertilizer is a must for watering-in small transplants. Use a mixture of 3 oz. of AGGRAND 4-3-3/gal. of water for watering-in transplants. The addition of 1 to 2 ounces of AGGRAND Liquid Bonemeal (NBM) to the solution to increase phosphorus and calcium availability when watering-in the transplants will aid the fertilizer in promoting long term root development. Shrubs and trees should be soaked overnight in a bucket of 4-3-3 before transplanting. Use a mixture of 1 oz. of AGGRAND 4-3-3/gal. of water for bare root soaking.

- Avoid transplanting during the heat of the day to avoid root desiccation (drying out).
- Cloudy weather is the best time to transplant.
- Keep soil moist until plant root systems become well-established.
- Use a mixture of 1 oz. of AGGRAND 4-3-3 with 1 gal. of water for bare root soaking.
